

THIS REPORT CONTAINS ASSESSMENTS OF COMMODITY AND TRADE ISSUES MADE BY USDA STAFF AND NOT NECESSARILY STATEMENTS OF OFFICIAL U.S. GOVERNMENT POLICY

Required Report - public distribution

**Date:** 4/30/2015

**GAIN Report Number:** UP1515

## **Ukraine**

## **Oilseeds and Products Annual**

## **Report**

**Approved By:**

Agata Kingsbury, Global Commodities Analysis Division

**Prepared By:**

Denys Sobolev, Agricultural Specialist

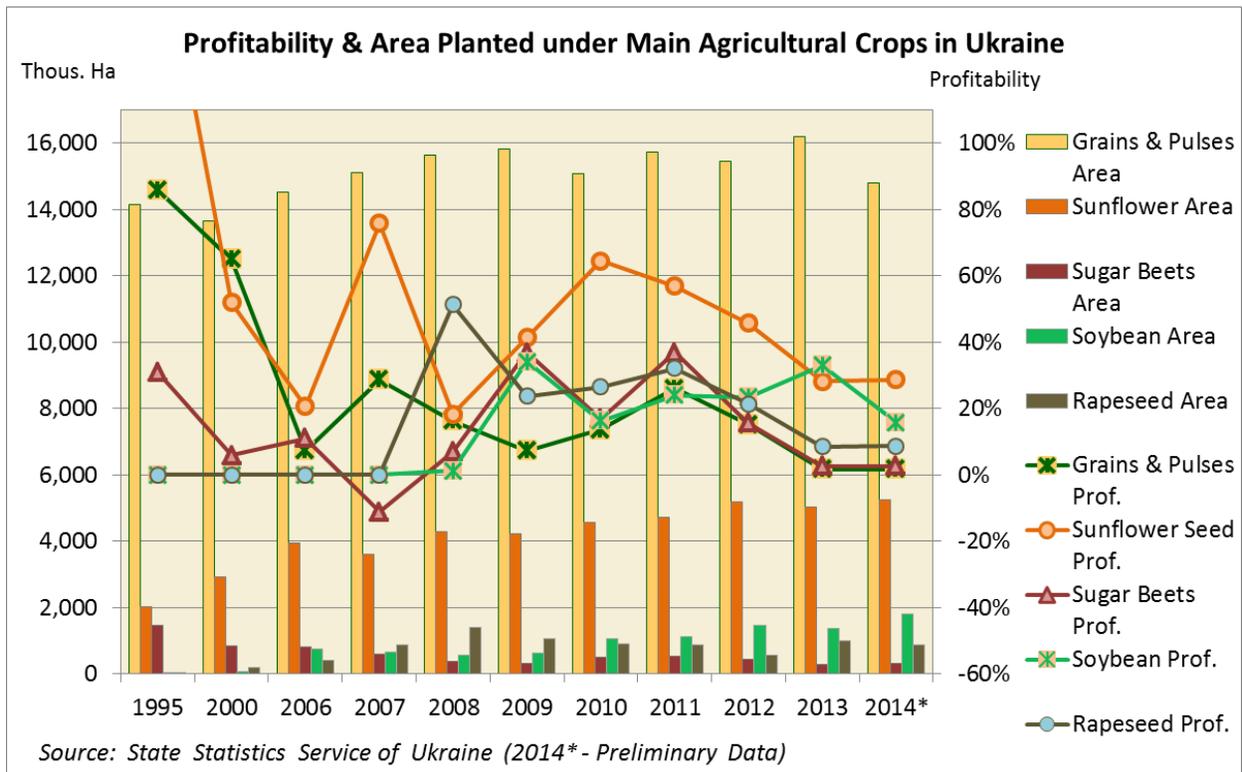

**Report Highlights:**

Oilseeds and products in Ukraine are expected to be relatively more profitable than grains in 2015. Farmers have expanded planting acreage, weather outlook remains positive, although economic factors might impact yields and expectations. The expansion of domestic crush capacity will stimulate the outflow of processed oil products both to domestic and international markets. Ukraine's oilseed sector will provide a positive boost to the national economy as a large earner of foreign currency.

**Executive Summary:**

Overall, the oilseed planted area in Ukraine in marketing year (MY) 2014/15 is projected to increase due to the expansion of soybean plantings (by five percent or up to 1.9 million hectares (mln ha) compared to 1.8 mln ha in MY 2014/15). This year’s crop has shown favorable results in terms of output and profitability in comparison to last year and is attracting more growers on the expectation of strong world market prices. For the purpose of this report, the term “profitability” means ratio between variable costs and sales of producers for different crops reported by the national statistics authority in Ukraine.

According to official data (see Table 1 and a graph below), soybeans and sunflowerseed (SF) were the two major oilseed crops in Ukraine in MY 2014/15 that maintained relatively strong profitability while producers of other crops reported a difficult marketing season and were even struggling to breakeven. The price of oilseed over other grains is significant – on average 20-30 percent higher.

Source: State Statistics Service of Ukraine, (-) indicates data not available, 2014\* - preliminary data

It is anticipated that agricultural crop production in 2015 will be impacted by the following factors:

- escalating economic instability since the end of 2013 in Ukraine
- local currency (Hryvna - UAH) devaluation, approximately 400 percent of value was lost since 2013 (refer to section Macroeconomic Impact)
- political hardship and instability in the country in the recent months
- sharp increase in the Producer Price Index; the cost of most agricultural inputs has increased such as fertilizer and pesticide chemicals-- a significant share of which are traditionally imported
- increase in fuel and seed costs
- significant reduction of agricultural producer profit margins in the previous harvest
- intermediary financing for agricultural production is only available for the short term (one to three months at exorbitantly high interest rates) and prohibitive in terms of costs to producers.

The following factors are deterministic to Ukraine's farmers who must reduce production costs for the 2015 harvest. Producers are trying to adapt to this new business environment. Lower fertilizer and chemical applications to the 2015 crop can be expected. Some producers report choosing non-brand products which are lower in price and quality. Also, since seed costs constitute for some crops over 30 percent of the input expenses, agricultural producers will be using lower cost and quality seeds as well. Under these conditions, average crop yields are not expected to reach record high levels. However, the export orientation of agricultural commodities production in Ukraine, especially in the oilseed and grain sectors, is expected to allow local producers to benefit from the inflow of foreign currency as a result of sales to the world markets.

Overall oilseed crush capacity in Ukraine grew slightly in 2015 and reached 14.5 MMT mainly due to technological upgrades made in the existing crushing plants that allowed a larger threshold and variety of oilseeds to be crushed at higher speeds, improved output quality, etc. In addition, a few new oilseed crushing and transshipment facilities are planned to enter into operation in the near term in Ukraine allowing to reach crush capacity up to 15 MMT in 2015.

Oilseed meal consumption has been gradually increasing in Ukraine in the last five years due to strong demand from still expanding industrial poultry and animal production (slowly growing) in the country. Stronger world market demand for oilseed meal has also stimulated Ukraine's export growth and is expected to continue fueling sales and profitability in the future.

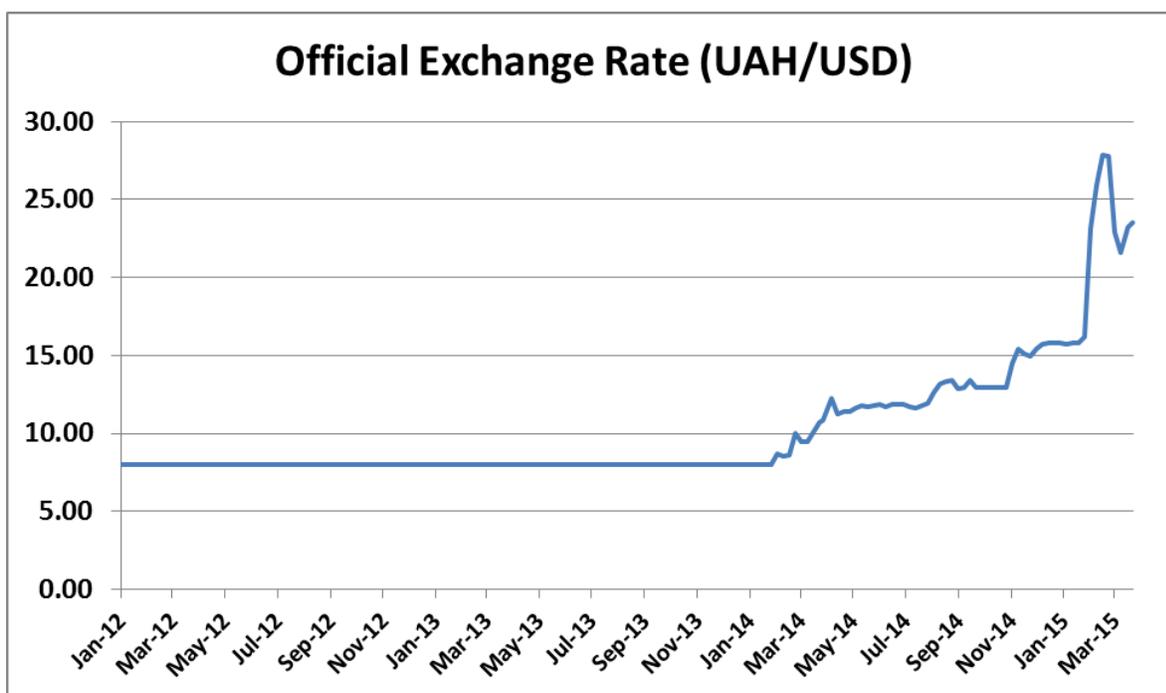

Strong consumer demand in the European Union (EU) for Ukraine's oilseeds meal is expected to continue, especially for rapeseed, rapeseed oil and sunflowerseed meal. Purchasing expectations from

soybean buyers in Middle East markets remains strong. China and other East Asian markets are expected to increase their purchases of Ukraine's soybean meal and sunflower oil in FY2015.

There were no obvious or significant policy changes in the agricultural sector in Ukraine in 2014 and during the first quarter of 2015. However, the economic and political situation, instability in the country observed in the recent months may lead to some policy adjustments before the yearend.

### Macroeconomic Impact

Ukraine's present political and economic crisis has led to a significant devaluation in the local currency (Hryvna – UAH) and a number of trade-related problems associated with the devaluation's inflationary tail-end effect. The National Bank of Ukraine (NBU) for years maintained monetary policies aimed at maintaining stable exchange rates. The target currency for this approach was the U.S. dollar, despite the fact that trade with U.S. was not significant compared to trade with the Russian Federation or the European Union. The policy of fixed exchange rate limits trade activity. Trade imbalances are drying up the country's foreign currency reserves, which may lead to periodical currency crises that outweigh the positive impact of a stable exchange rate. Significant political and economic shocks undermined UAH stability in 2014 resulting in abrupt devaluation.

Source: National Bank of Ukraine

Total currency devaluation in 2014 reached almost 100 percent-- undermining imports and boosting exports. Another surge came in February 2015, further devaluating the national currency by almost 50 percent.

However, the positive gains made by exporters from the devaluation may be limited, as the devaluation also increased the value of essential agricultural inputs, most of which are imported, for the 2015/16 MY crop that could also influence production more significantly than in the previous MY.

Foreign currency exchange rate fluctuations led to a variety of problems for chemical and seed importers. Many of them reported delays (over a month) when trying to procure foreign currency, and these complicated purchasing procedures do not allow for any exchange rate planning by the trade. Administrative measures implemented by the NBU intended to restrict access for foreign currency

purchases required to import products. Input use for the MY2015/16 crop is expected to be lower than usual, but a significant drop is not expected for oilseeds as they remain the most profitable and reliable of all cash crops for farmers.

### Select Agricultural Input Imports (January – December 2014)

HS Code	Description	Unit	Quantity			% Change

Source: World Trade Atlas

Another factor, which might influence the cost of inputs as well as volumes of their consumption by farmers, are the amendments to the Tax Code of Ukraine introduced by the Law of Ukraine “On Measures for Stabilization of Balance of Payments of Ukraine in Accordance with Article XII of General Agreement on Tariffs and Trade of Year 1994” on December 29, 2014. The abovementioned law envisages increases of ad valorem for HS Groups 1-24 by 10 percent and HS Groups 25-97 by 5 percent.

These amendments shall give further impetus to already inflated prices (because of the devaluation) for the whole spectrum of seed and agrochemical products, machinery and machinery parts used in plant production (except for fuels which are considered critically important imports and are exempt from the increase in tariff rates) and considered controversial by representatives of agribusiness. At the time this report was drafted, the Government of Ukraine indicated that it would lower these tariffs; however, no action has actually been taken to date.

#### Commodities:

Oilseed, Sunflowerseed

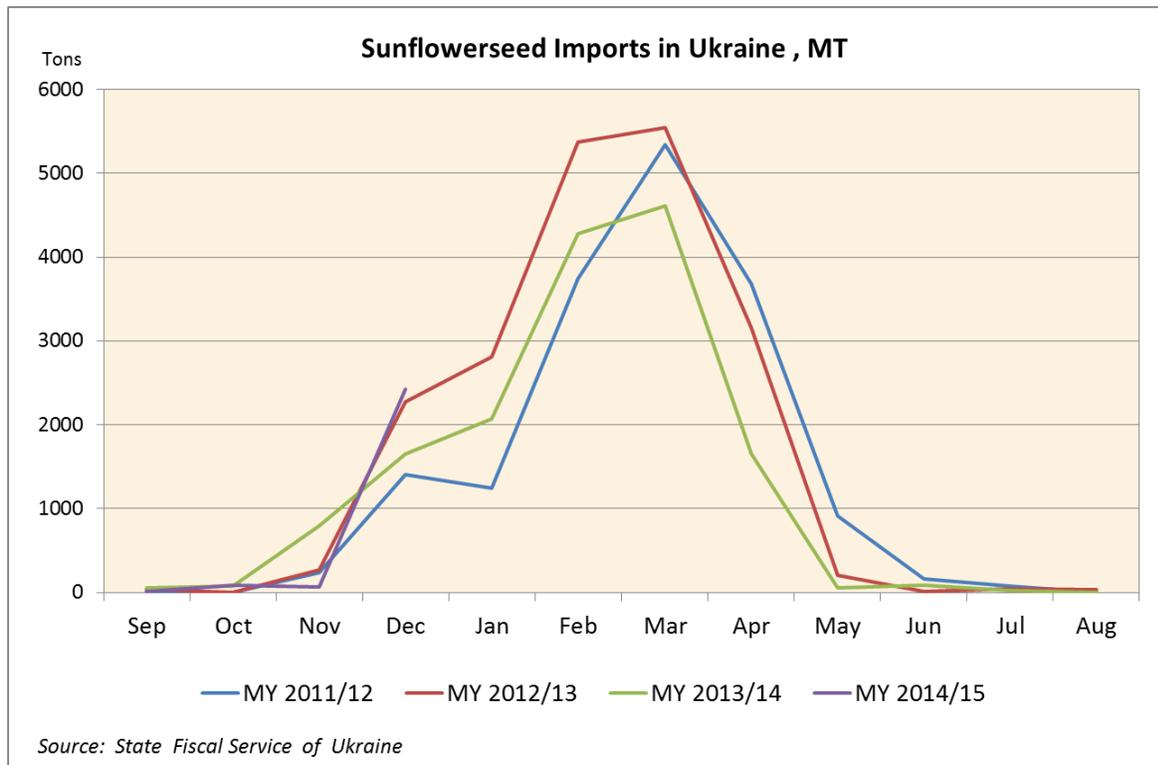

#### Production:

Production of sunflowerseed in Ukraine in MY 2015/16 is projected at the level of 10 MMT, which is just 1.3 a percent lower compared to almost 10.2 MMT (FAS-Kyiv estimates) is projected for MY 2014/15 harvested in fall 2014.

Sunflower planted area in MY 2015/16 is expected to remain similar to that of the previous season (see PSD table at the end of this section). FAS-Kyiv projects sunflower seed yields in the new season will remain above the five-year average, but just below last year’s official country average yield of 21.2 MT/ha, as producers will try to cut costs for imported agricultural inputs.

Seed imports during September 2014 – January 2015 for spring 2015 plantings remained at relatively favorable levels and above the previous seasons (see graph below for more details and see Statistical Tables at the end of this report). U.S. sunflower seed exports usually account for one third of imported planting materials in Ukraine, however this season so far (exports from September 2014 to January 2015)

U.S. planting seeds fell below suppliers from Turkey, who are accounting for over 40 percent of seeds supplied to date and this resulted in a drop for other EU suppliers for the same period as well.

Considering the overall economic situation in the country prior to and at the time of the spring planting season this year, producers are not expected to maximize sunflower yields. Rather, they are expected to reduce purchases of quality inputs, using significantly fewer chemical applications, and in general modifying production technology to reduce production expenses.

During the past few seasons FAS-Kyiv has been adjusting sunflower production quantities reported annually by the State Statistics Service of Ukraine to produce estimates that in USDA’s view better reflect the true situation in the industry in Ukraine. Ukraine’s historic sunflower oil exports were one of the most significant pieces of data used to support these production estimate calculations. Other data like domestic sunflower oil consumption (that has been relatively steady year over year) as well as industry data mining and other sources were used to arrive at the most reasonable sunflower seed, oil and meal production estimates. It is important to note that at the time of this report was drafted, the current and the upcoming season projects are developed along with recalculations of estimates for the past seasons. Thus, some adjustments were made to MY 2013/14 and MY 2014/15 that are shown in PSD tables at the end of this report section.

**Consumption:**

Almost all sunflowerseed produced in Ukraine is crushed domestically, as this has been the case over the last decade. A small share of sunflower seed is consumed raw for food and by the confectionary industry. Crush and consumption statistics for the last few seasons were revised by FAS-Kyiv to correspond better to officially reported sunflower oil production and exports for these seasons and to better reflect industry trends.

The sunflower crush at the start of the MY 2014/15 was faster than in the previous marketing year as sunflower seed prices stabilized after their drop in MY 2013/14; however, producers are expected to hold stocks in order to finance their spring planting intentions for MY 2015/16.

For MY 2014/15 local consumption of sunflower is expected to follow the usual trend unless Ukraine changes its sunflowerseed export tariffs.

#### Trade:

Over the last few seasons sunflower seed export quantities in Ukraine have declined due to attractiveness of selling directly to the domestic market (mostly for crushing). While Ukraine exported over 280,000 tons of sunflower seed in MY 2011/12, exports in MY 2013/14 totaled just below 70,000 tons (see Statistical Tables in the end of this report). The similar situation is expected to hold in MY 2015/16 and Ukraine is expected to export about 70,000 MT of sunflower seed as well and which is less than one percent of overall production.

In MY2013/14, France and Turkey purchased over 30,000 tons of sunflower seed (over half of all sunflower seed exported from Ukraine) and in the first four months of MY 2014/15, due to low exports of sunflower seed from Ukraine, Romania, Azerbaijan, Bulgaria and Poland became the top export destinations for Ukraine's sunflower seeds. Due to excess processing capacity, Ukraine will continue lose its role as sunflower seed supplier in MY 2014/15 as national crush facilities have sufficient capacity to process all sunflower seed produced domestically.

**Commodities:**

Oilseed, Soybean

**Production:**

The soybean planted area in Ukraine in MY 2015/16 is expected to increase by about five percent or up to 1.9 mln ha compared to 1,8 mln ha planted in MY 2014/15. Production is projected to reach roughly 4 MMT with expected average yields at the level of the previous season. The following factors play in favor of soybean production expansion in Ukraine:

- Good returns on soybean production compared to other agricultural crops produced in Ukraine
- Attractive world market outlook for soybeans and products for the upcoming season
- Strong domestic demand from domestic poultry and animal husbandry sectors
- Relative ease of Ukraine's soybean exports
- Favorable soil moisture and other climatic conditions for the production of soybeans in Ukraine (mainly north-central regions)

Soybean profit margins for agricultural producers in Ukraine in the last six years remain positive, for the last three years and for the previous two years significantly surpassing that of rapeseed and grains. In MY 2014/15, on average in the country, soybeans have become the second most profitable crop after sunflower (refer to Table 1). This makes the crop more attractive to local producers while production costs and technology are not the most expensive or complex compared to other crops (e.g. sunflower).

Soybean planting area in Ukraine has been expanding gradually over the last decade – from a mere 65,000 ha in 2000 to 1.9 mln ha (projected by FAS/Kyiv) in 2015. This growth is mainly stimulated by the export attractiveness of this oilseed. Also, domestic soybean production is expected to continue responding to domestic demand from domestic industrial poultry and animal husbandry operations supported by expansion of domestic crush capacities.

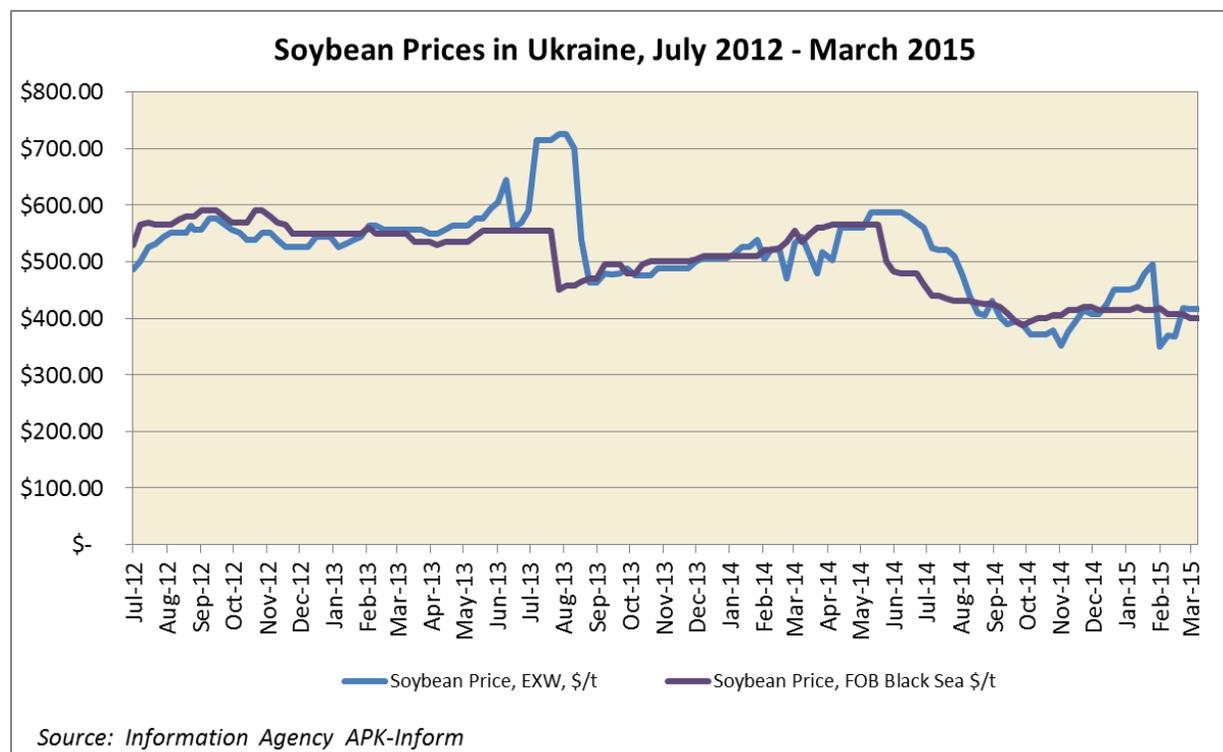

Production of Genetically Engineered (GE) crops in Ukraine is still not allowed since none have passed the official registration and approval process so far. However, industry rumors still indicate that Roundup Ready soybeans continue to be produced in the country. The share of this variety in the past was rumored to reach up to 80 percent of Ukraine's total soybean production. GE varieties might seem to be more attractive for agricultural producers for MY 2015/16 as the price of agrochemicals are peaking in price when compared to the previous year (refer to section Macroeconomic Impact).

**Consumption:**

Soybean consumption in MY 2015/16 is expected to increase by about 3.7 percent compared to the previous marketing year. A major share of soybeans produced in Ukraine – over 20 percent – are intended to be used up by domestic crushing industry. Part of this quantity ends up as soybean oil and meal for exports and the rest is consumed domestically as full-fat or regular soybean meal.

**Trade:**

Over half of all soybeans produced in Ukraine are exported and in MY 2014/15 exports are expected to reach 2.1 MMT, up 66 percent compared to the previous season. In MY 2015/16 exports of soybeans are projected to remain at the same level.

Relatively good soybean world market prices in the current marketing year and similar prospects for the coming year steadily supported Ukraine's soybean exports in these seasons (see historic price data in the graph above). March 2014 decreased in EXW prices observed in the graph due to significant and sharp exchange rate fluctuations in Ukraine. Local commodity prices are currently fluctuating in line with the national currency and will be adjusted to reflect the export price as soon as the currency hikes stabilize.

Also, the graph below shows that at the end of 2013/14 season, local prices were higher than export (FOB) prices. Such a trend was observed while local stocks were running tight but demand from the local feed industry was also running high due to poultry and animal production expansion in the country. Soybean FOB prices were more or less consistent with buyer offers. To satisfy local feed demand, Ukraine imported small quantities of soybean meal in summer 2014.

The top buyers of Ukraine's soybeans for the last three seasons remained the same and in MY 2013/14. Italy decreased its purchases of Ukraine's soybeans down to 0.3 MMT (21 percent share), Turkey ranked second with a sharp increase of consumption at level of 0.24 MMT (19 percent), and Egypt has scaled back imports to 0.16 MMT (13 percent). Ukraine's soybean exports to EU dropped almost by a third to Greece, Spain, Hungary and Poland's imports ranging between 0.3-0.8 MMT (please see statistical tables at the end of this report for more details).

In the recent year, there was a noticeable increase in demand for Ukraine's soybeans from Russia, Spain and Hungary.

Between September and December 2014 out of 1.1 MMT total Ukrainian soybean exports a significant share have been diverted to markets in Middle East countries, including Iran – 104.7 MT, and Saudi Arabia – 38.5 MT due to lockdown of Russian market. At the same time Turkey, Egypt and Greece still remain at the top of the list (for more details see statistical tables at the end of this report).

Soybean imports were minimal and constitute mostly planting seeds.

CY Exp. to U.S. (1000 MT)	0	0	0	0		0

**Production:**

Production of rapeseed in MY 2015/16 in Ukraine is expected to be at the level of 2.5 MMT – around a 14-percent increase compared to 2.2 MMT produced in MY 2014/15 – a relatively large crop anyway. Overall favorable weather conditions for rapeseed in winter 2015 resulted in very low winter rape losses (usually over 90 percent of all rapeseed sown in Ukraine is winter rape) of about six percent.

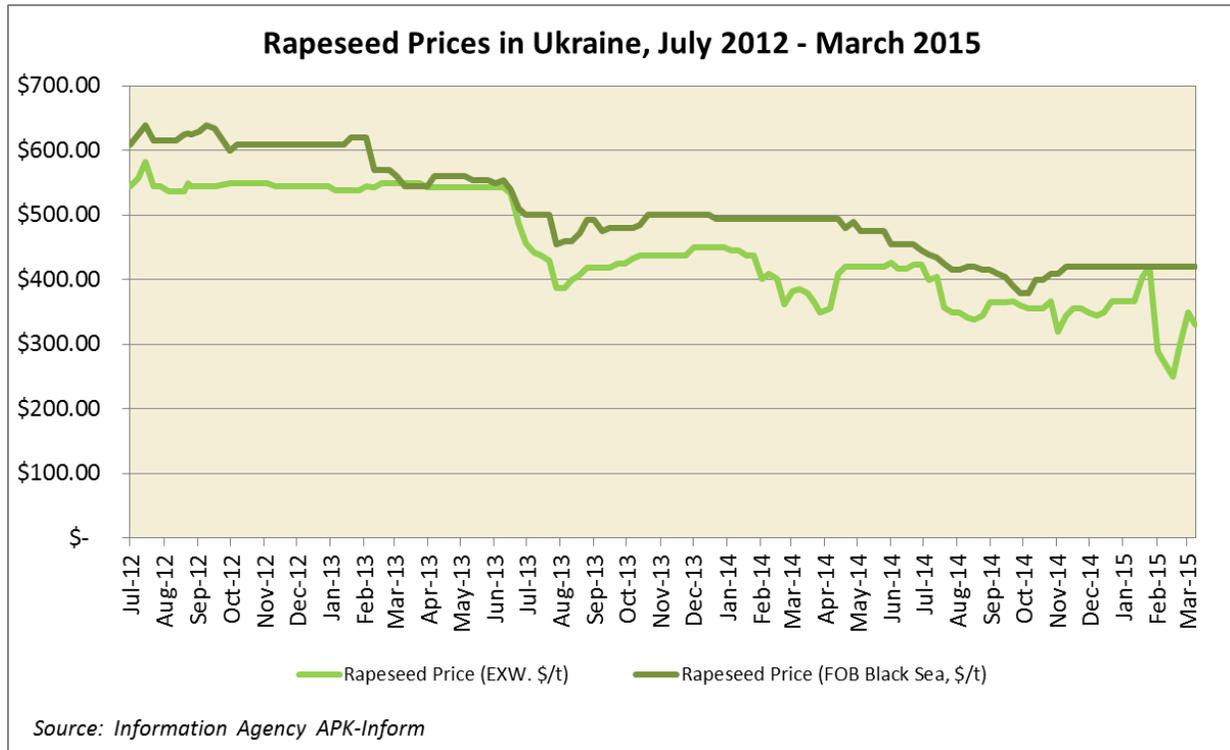

Planted area under rapeseed for the MY 2015/16 crop is projected to be slightly higher to that of the previous season and yields should remain on the level of the previous season as winter climatic conditions were generally favorable for winter crops. However these indicators might be corrected due to below-normal NDVI in some oblasts (refer to climatic map at the end of Report) indicating the poor fall establishment conditions as well as expected lower input use and quality (refer to section Macroeconomic Impact).

**Consumption:**

Domestic rapeseed crush (though still insignificant, but quickly growing) is the only force competing with exports. Overall oilseed crush capacity in Ukraine remains high and attractive rapeseed oil export prices stimulated the industry. The industry has benefitted from producing and exporting this value-added product. The rapeseed crush in MY 2014/15 is projected to reach up to 238,000 MT, up by almost 40 percent compared to the previous year. It is then expected to increase again by about seven percent up to 333,000 MT in MY 2015/16. Ending stocks for rapeseed are kept at minimum levels in Ukraine because of little demand for domestic use of this commodity.

**Trade:**

In MY 2014/15, world oil prices were dropping and this was one of the factors behind a decrease of domestic rapeseed crop prices in Ukraine (see graph below) as this crop is extensively used for biofuel production. Good rapeseed crop in MY 2014/15 in Ukraine and devaluation of national currency stimulated the high pace of exports at the start of the season. Just over 1.8 MMT of rapeseed or almost 90 percent of the project marketing year total were exported between July and December 2014 with 80 percent of sales happening in the first four months of the season (see statistical tables at the end of this report for details).

The European Union remains the largest buyer of Ukraine's rapeseed and is expected to remain at the top in the new season. However, just as with the other of Ukraine's oilseeds and oilseed products, Asian buyers are starting to show interest in rapeseed. According to official data, in MY2013/14, Pakistan purchased 234,008 MT of Ukraine's rapeseed, or over ten percent of the overall rapeseed exports and the United Arab Emirates procured 133,641 MT (almost a six-percent share).

Between July and December 2014, the EU has already imported almost 65 percent of rapeseed produced in Ukraine, and Pakistan has become the largest buyer during this period with 420,600 MT increasing its imports twofold compared to the same period during the previous year.

**Commodities:**

Oil, Sunflowerseed

Oil, Soybean

Oilseed, Rapeseed

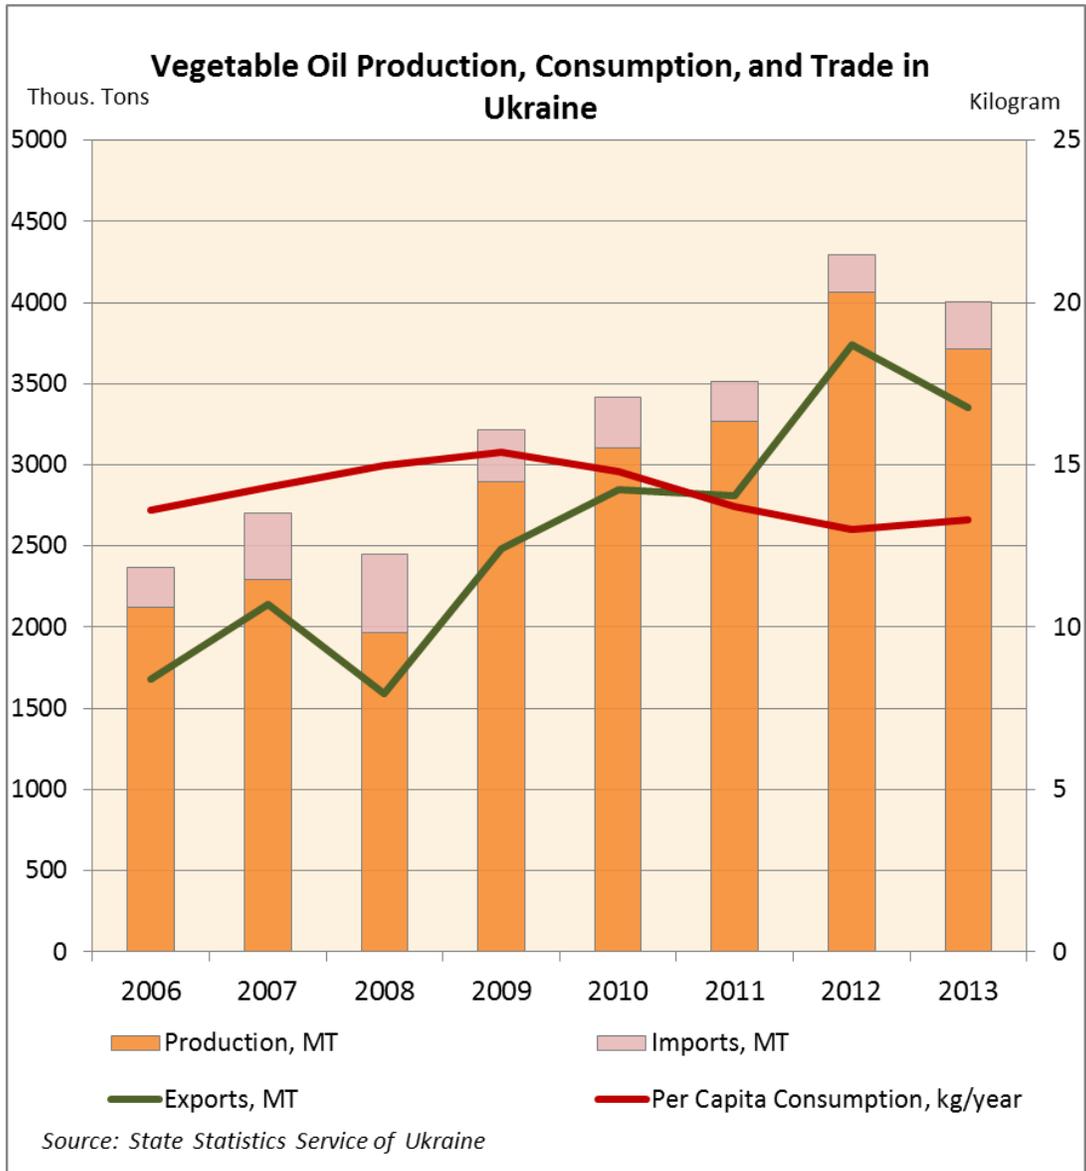

**Production:**

Production of sunflower oil has been increasing in Ukraine over the last decade fueled by growth in the production of sunflower seed from almost 3.5 MMT in 2000 to almost 10 MMT in MY2014/15. Ukraine has been the major world market supplier of sunflower oil and is set to remain in this position for the coming seasons. By the end of the current marketing year, sunflower oil production in the country is expected to reach almost 4.2 MMT, which is just 10 percent lower than in MY2013/14 due to slightly decreased yield of this crop. And for the coming MY 2015/16 sunflower oil production in Ukraine is forecasted to stay on approximately the same level 4.2 MMT (see PSD tables at the end of this section for more details).

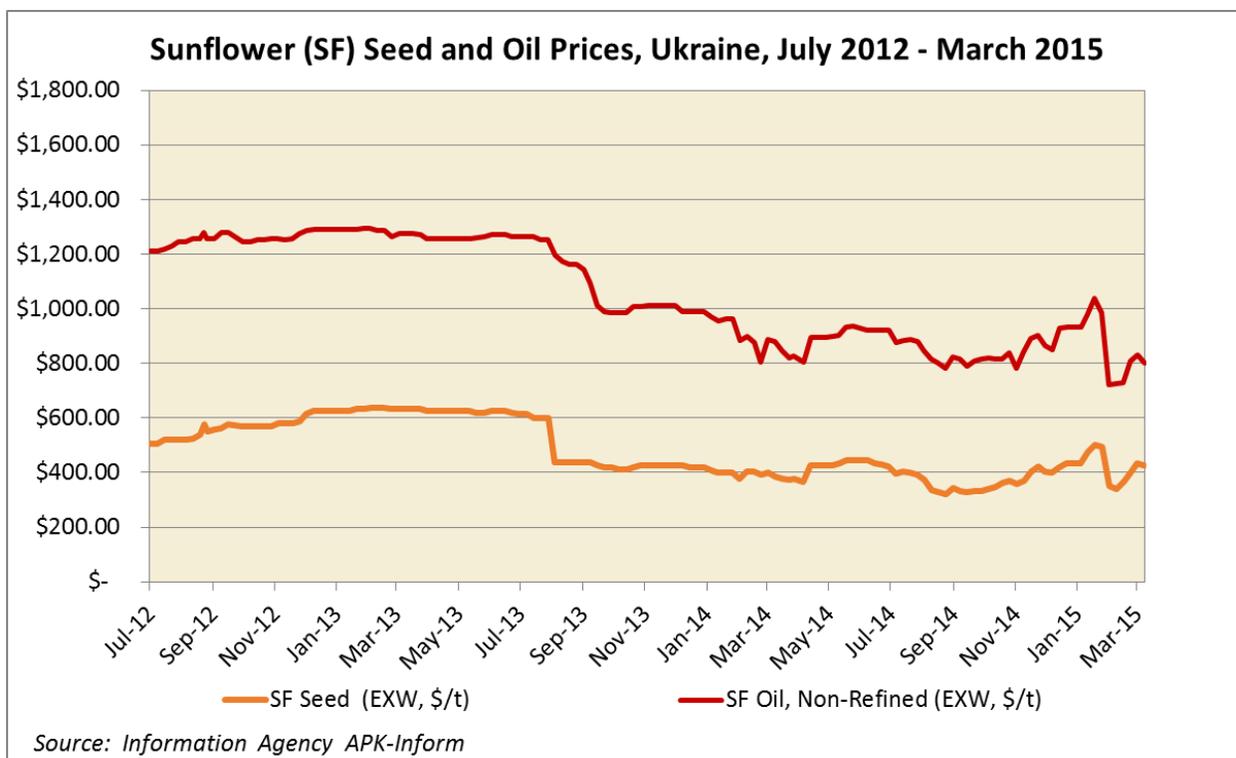

**Table 2. Vegetable Oil Production, Consumption, and Trade in Ukraine**

Source: State Statistics Service of Ukraine

Sunflower crush development in Ukraine has been driven by sunflower oil exports. This commodity has been providing Ukrainian producers unbeatable profits for almost a decade. However, the increased production of oilseed crops worldwide is driving down Ukraine’s sunflower oil prices. Sunflower seed and oil producers in Ukraine none-the-less were still making relatively good profit off of these products compared to grains and sugar beets producers that have been struggling to break even in the current season.

Also, sunflower oil production estimates were reviewed and changed for several preceding seasons. Undeclared sales of sunflower seed are said to exist in Ukraine, so underreporting of this oilseed and oil production is an issue every season. USDA relies mainly on official commodity exports data and on estimated domestic sunflower oil consumption to revise its sunflower seed, oil, and meal production estimates. PSD tables are located at the end of this section and reflect the most recent changes made.

Soybean oil production has been on the rise in Ukraine with growing overall oilseed production and in MY2015/16 is expected to reach 205,000 MT. Major oilseed crushers developed the capacity to process various oilseeds in the same facilities, and adding to their ability to adapt and service changing market needs more efficient and effectively than in previous years. The soybean crush is mainly driven by domestic poultry and animal production with oil being a derivative-product most of which is exported. A large share of soybeans crushed in Ukraine is made into full-fat soybean meal.

Ukrainians are not used to consuming soybean or rapeseed oils for food. Thus, these commodities are mostly destined for exports as value-added products, while soybean and rapeseed meal is fed to animals.

Rapeseed oil has become a new product of interest for Ukraine's crushers in the last season mainly due to the demand from the EU. Many large crushers in Ukraine are now able to process rapeseeds in their facilities and thus tried the product out for its value-added benefits. Rapeseed oil production in MY 2015/16 is expected to reach almost 130,000 tons, with major share of that being exported.

### Consumption:

Sunflower oil consumption in Ukraine has been quite constant over the years. The overall trend starting in 2009 is downward (see Table 2 and a graph that follows earlier in this report). The slowly declining population is the main reason behind the observed trend. In addition, orientation towards healthier and simpler product diets and significantly decreased average incomes of the population within the last year and a half are the other significant factors at play.

Soybean and rapeseed oils have never been popular food products for Ukrainians, though sunflower oil traditionally is a staple food used in salads as well as for baking and frying purposes. There is some insignificant increase in soybean and rapeseed oil use observed in the last few years in the country mainly coming from food processing and other industrial uses. This trend can be explained by the fact that these oils are now produced in Ukraine in larger quantities and become available for domestic consumption.

**Trade:**

During the first four months of the current season, from September to December 2014, Ukraine exported about 1.39 MMT of sunflower oil, about 13 percent above the quantity exported for the same period a season earlier driven by the need for additional financial resources by exporters and farmers. In MY 2013/14 Ukraine exported almost 29 percent more than in the previous marketing year despite the drastic drop in sunflower oil prices at the start of the season (see graph with price data earlier in this report in the section on sunflower seed production and trade).

Overall sunflower oil exports from Ukraine in MY 2014/15 are projected to reach 3.6 MMT, down by 14 percent on previous MY 2013/14 when exports peaked to 4.1 MMT driven by high sunflowerseed production.

MY 2015/16 exports are forecast to remain at level of 3.6 MMT, due to decreased export prices and expected average yield this year.

Ukrainian sunflower oil is exported to over a hundred countries in the world. India, China, Egypt and Iran were the top buyers in the previous years, with India usually purchasing over 30 percent of annual sales from Ukraine. However, the share of China nearly doubled and other North East Asian countries has been on the rise in recent seasons (see statistical tables at the end of the report for greater details).

Soybean oil exports in the last few seasons have been expanding due to the rise in production and are expected to reach over 197,000 MT by the end of MY 2015/16, which is 30 percent higher than in the previous season.

Traditionally, in MY 2013/14 the top buyer of Ukrainian soybean oil is Poland, purchasing around 40 percent of all soybean oil sold by Ukraine. Spain ranked second with 28 percent, and the EU purchased around 61 percent of Ukraine's soybean oil exports.

In September-December 2014 soybean oil exports were almost 12 percent higher than for the same period of the previous year as export prices stabilized and producers intensified their trade. The major trend for soybean oil exports at the beginning of MY2014/15 is that Poland remains the major destination for over 40 percent of Ukraine's soybean oil, while China purchased over 8,000 MT for the same period.

Ukraine is expected to continue exploring various destinations for its soybean oil exports in the coming seasons as soybean crush capacity has been developed in the country and the attractiveness of this value-added product attracts the trade's interests.

Ukraine's rapeseed oil exports have grown significantly from as little as 255 tons in MY 2010/11 to a projected 91,000 MT in MY 2014/15 (see PSD table in the end of this section) and in MY2015/16 this number is expected to increase by over 30 percent up to 121,000 MT driven by increased crush volumes.

In the first half of the current season, between July and December 2014, Ukraine exported 89,479 MT of rapeseed oil (see statistical tables in the end of this report for more details). Over 65 percent of this oil was purchased by the EU. Another notable buyer was China with 26,413 MT purchased or almost 30 percent share of total Ukraine's rapeseed exports and India retained its position of third largest importer with 3,934 MT for the period.

**Commodities:**

Meal, Sunflowerseed

Meal, Soybean

Meal, Rapeseed

**Production:**

Sunflowerseed meal will continue to be produced in large quantities in Ukraine as a byproduct of oil production. In addition, more soybean meal is expected to be produced due to an increase in soybean production in the country and in response to a strong demand from domestic poultry and animal production. Rapeseed meal production, though insignificant, is anticipated while rapeseed oil production is increasing in Ukraine.

**Consumption:**

Oilseed meal in Ukraine is used in poultry and animal production and a large share of it also exported. Sunflower meal is a traditional feed component in Ukraine. Soybean meal has been gaining popularity in the country with the establishment of large industrial poultry production facilities that are still expanding. For more details please refer to FAS-Kyiv Poultry and Livestock and Products reports in the GAIN system.

Soybean meal demand in the country is driven by already large and still expanding poultry production operations (seven percent growth in 2014). Livestock production in Ukraine is also substantial. In 2013 State Statistical Committee reported about 7.9 million pigs and over 2.5 million head of dairy cows (beef cow population is almost non-existent). The headcount for swine increased in 2014, while beef population slowly deteriorated. The ongoing political and economic crisis in Ukraine is expected to have adverse impact on animal inventories as disposable incomes and animal protein consumption is decreasing.

Soybean meal made with MON 40-3-2 (Roundup Ready) soybeans were include in the Registry of Feed Sources, Deed Additives and Veterinary Drugs that Contain GMOs or Were Derived From GMOs (refer to the GOU Registry at the following link: <http://vet.gov.ua/node/888>). According to the official document, this GE source of feed is temporarily allowed for use in Ukraine from July 23, 2013 until July 22, 2018.

**Trade:**

In MY2013/14 Ukraine supplied over 65 percent of its sunflower meal to the EU and the major share went to its traditional buyers – France (almost 17 percent), Belarus (up to 16 percent share) and Poland (around 15 percent share) – and according to export data for September-December 2014 they are anticipated to remain as the major market destinations for the upcoming season. Turkey's share of sunflower meal purchases from Ukraine decreased over the last few seasons. For marketing year 2015/16, Ukraine's sunflower seed meal exports are forecast to drop by around eight percent compared to the current season due to a projected lower new crop.

Ukraine's soybean meal exports are insignificant in quantity, under ten percent of overall soybean meal production in the country, because of high demand from domestic buyers. Also, to satisfy demand from local poultry producers, Ukraine imported a few shipments on soybean meal in 2014 at the end of the season when domestic stocks were depleted. A similar demand situation may be expected in the current and the upcoming season while domestic poultry and animal production is growing, however import volumes will be decreasing due to the expansion of local crush facilities.

In MY2013/14 Ukraine exported over 80.000 MT of rapeseed meal with 84 percent of exports designated to EU and the rest was supplied to Israel that was the second major export destination and imported over 12.000 MT of this product. According to export data for September-December 2014 exports increased by around 55 percent with EU and Israel remaining two major export destinations and this trend is expected to continue into MY2015/16 with exports reaching around 168.000 MT.

**Policy:**

Agricultural Policy in Ukraine in regard to oilseeds and oilseed products has not changed much over the last year. Some developments are being discussed at the time this report was written and others are pending implementation as follows.

In January 2015, there was a draft law developed that is intended to abolish existing 16 percent export duty for sunflowerseed since the day the draft is adopted. Agrarians in Ukraine have split in their opinion on the subject and some are lobbying the GoU for this law, while others are opposed to it.

On one side, development of modern and extensive sunflower seed crushing industry have become possible in Ukraine when the Government limited exports of sunflower seed in the late 90's – and early 2000's by introducing an export duty. Sunflower seed exports then became less attractive than sales in the domestic market. Sunflower seed crush increased significantly allowing domestic producers to benefit from sales of the value-added products. At present, some local businesses are interested in similar support for the domestic soybean crush development as a number of local oilseed crushers already have the capacity to process soybeans, however this initiative becomes highly improbable since Ukraine signed Association Agreement with the EU.

According to UkrOilProm (oilseed crushers associations in Ukraine represent over 90 percent of all oilseed processing plants in the country) crushing facilities in Ukraine are able to process about 11 MMT of sunflower seed a year. This figure already exceeds the total sunflowerseed quantity produced in Ukraine so far. Overall oilseed crush capacity in the country reached 14.5 MMT in 2014 and could be expanded further up to 15 MMT in 2015 making this market highly competitive and creating basis for increased interest in larger involvement in soybean processing.

Policy that remains in place in Ukraine is as follows.

Among the requirements that Ukraine accepted upon WTO accession in 2008 was a commitment to reduce its export duties on oilseeds. Consequently, over the last years, sunflowerseed export duties in Ukraine were cut down to its present value of ten percent. No additional reduction is required by WTO.

Ukrainian legislation does not allow for the production of genetically engineered (GE) crops in the country. Also, the Ministry of Agricultural Policy and Food of Ukraine requires all planting seeds intended for import into the country to be tested for the presence of genetically modified organisms (GMO).
