South African Sugar Production Forecast to Grow Despite Revenue Pressures

Approved By:
Laura Geller, Senior Agricultural Attaché

Prepared By:
Wellington Sikuka, Agricultural Specialist

Report Highlights:
Post forecasts the South African sugar cane crop will increase by 2 percent to 19.5 million Metric Tons (MT) in the 2019/20 Marketing Year (MY), due to normal weather conditions, improved sugar cane yields and increases in area planted for small scale growers who receive support from the industry. Post forecasts that sugar exports will increase significantly by 18 percent to 1.4 million MT in the 2019/20 MY, based on the increase in sugar production, and reduced domestic demand caused by the impact of the tax on sugar sweetened beverages. South Africa is expected to fully utilize the United States Tariff Rate Quota (TRQ) allocation in the 2019/20 MY.

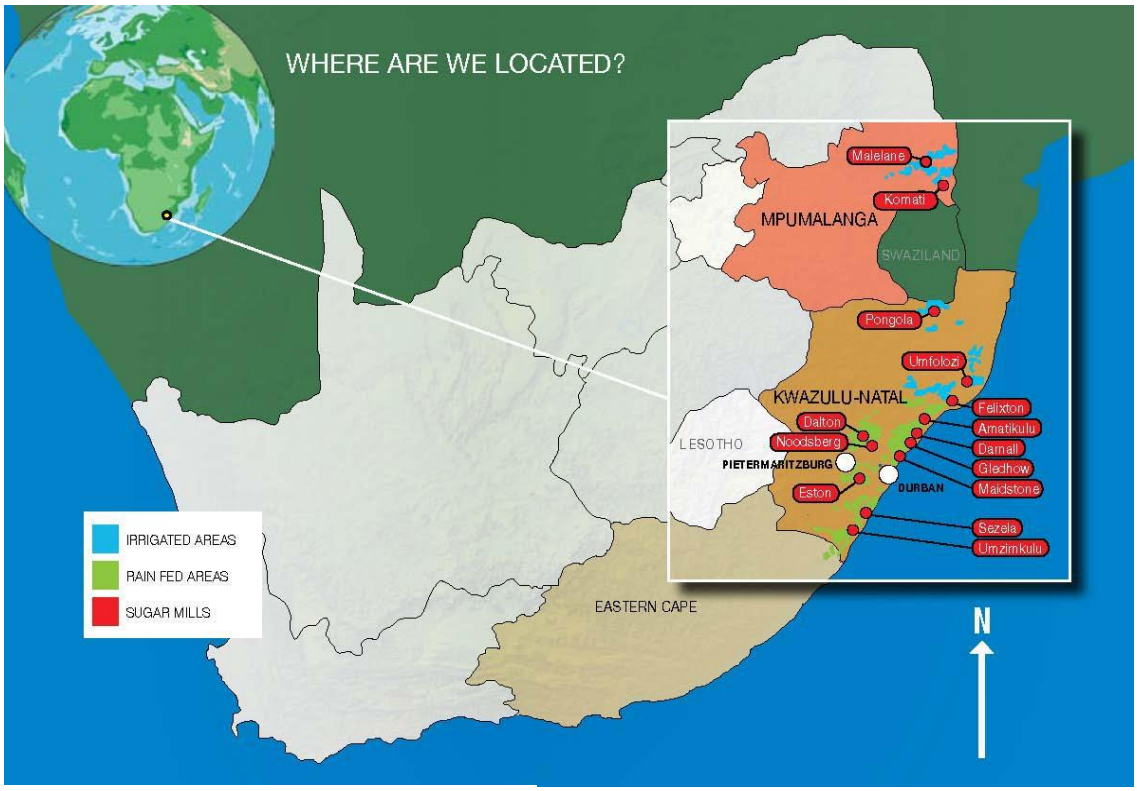
Background

Sugar cane in South Africa is grown in the Kwa-Zulu Natal Province and Mpumalanga Province as shown in **Figure 1**. Sugar cane production in the Kwa-Zulu Natal Province is 95 percent rain fed with limited irrigated areas, while production in the Mpumalanga province is fully irrigated using center pivots, sprinklers and the canal system. At least 80 percent of the sugar cane production is supplied by large scale farmers, and the remaining 20 percent of production is accounted for by small scale farmers.

The sugar industry classifies growers based on sugar cane production. Large scale growers refers to all growers producing above 1,800 MT of sugar cane, and all growers producing less than 1,800 MT of sugar cane are classified as small scale growers. Typically, small scale growers have less than 30 hectares, and the majority of small scale farmers in the communal areas have less than 1 hectare. In total there are approximately 21,500 registered sugar cane growers in South Africa, comprising of 1,300 large scale growers and 20,200 small scale growers. Both large scale and small scale farmers are required to sign a sugarcane supply agreement with a specific sugar mill to guarantee that they will supply the respective mill and that their sugar cane deliveries will be accepted.

Figure 1: Map of Sugarcane Production Areas in South Africa



Source: South African Sugar Association (SASA)

The South African Sugar Association (SASA) is funded by both growers and milling companies, and is the highest decision making authority in the industry on common issues for sugar cane growers and sugar millers. SASA provides support services to the entire industry's value chain including the export of all the raw sugar, cane testing, and policy advocacy. SASA was established by the Sugar Act of 1978 and is under the authority of the Department of Trade and Industry (DTI). **Figure 2** shows the structure of the South African sugar industry. The South African Sugar Research Institute (SASRI) is a division of the SASA and conducts research on sugar cane varieties, pests, diseases, and crop protection. SASRI also provides extension and meteorology services for the industry.

There are two associations representing sugar cane growers, the South African Canegrowers Association (SACGA) and the South African Farmers Development Association (SAFDA). SACGA was the first association established and currently represents predominantly white large scale growers with some small scale growers. SAFDA was formed in 2017, initially to represent the interest of black sugar cane farmers due to the slow pace of transformation in the industry, but currently also has some white commercial farmers as its members.

The South African Sugar Millers Association (SASMA) represents the interest of the six sugar milling companies; Tongaat Hulett Sugar Ltd, Illovo Sugar Ltd, Tsb Sugar RSA Ltd, Gledhow Sugar Company, Umfolozi Sugar Mill Ltd and UCL Company Ltd. These six milling companies own a combined total of 14 sugar mills, 12 in the Kwa-Zulu Natal Province and 2 in the Mpumalanga Province. The Tongaat Hulett Sugar Ltd, Illovo Sugar Ltd, Tsb Sugar RSA Ltd, and Umfolozi Sugar Mill Ltd produce both raw and refined sugar. The Umfolozi Sugar Mill Ltd and UCL Company Ltd only produce raw sugar. The Gledhow Sugar Company only produces refined sugar. Tongaat Hulett Sugar Ltd, Illovo Sugar Ltd, and

Tsb Sugar RSA Ltd also own sugar mills outside South Africa in eSwatini, Zimbabwe, Zambia, Mozambique, and Tanzania. The Sugar Milling Research Institute (SMRI) is involved in research on sugar manufacturing, and provides technical services to the Southern African sugar milling and refining industries.

Sugarcane:

Production

Post forecasts that the sugar cane crop will increase by 2 percent to 19.5 million MT in the 2019/20 MY, from 19.0 million MT in the 2018/19 MY. This is based on normal weather conditions, improved sugar cane yields and increases in area planted for small scale growers who receive financial, input and technical support from the industry. This increase will be partially offset by reduced cane production due to some growers diversifying to other profitable crops, and lower replanting from growers who are under financial distress. Increases in input costs (fertilizers, labor, electricity and fuel), and the lower sugar cane prices in the 2018/19 MY are expected to negatively impact growers in the 2019/20 MY. The 2018/19 MY production was revised downwards from 19.3 million MT to 19.0 million MT based on final industry data. There is no commercial sugar beet production in South Africa.

The impact of the drought on sugar cane production from the 2014/15 MY and 2016/17 MY is evident in **Figure 3**. Sugar cane yields are expected to increase to 69 MT/hectare (HA) in the 2019/20 MY, from 68 MT/HA in the 2018/19 MY. Notably, the variation in cane yields ranges widely from 30 MT/HA for dryland smallholder farmers in the Kwa-Zulu Natal Province to about 95 MT/HA for farmers in the irrigated growing regions of the Mpumalanga Province.

Higher costs of production, due to increases in fertilizer, electricity and fuel costs, and declining sugar cane prices have resulted in some farmers diversifying to macadamia nuts, avocados, citrus, vegetables and poultry production. To reduce the cost of electricity, the SACGA has started the production of electricity using biogas under their subsidiary company Womoba Pty Ltd in partnership with a grower. It is expected that should the project prove to be viable, some sugar cane farmers especially in irrigated areas would also invest in biogas projects to improve farm profitability and reduce electricity costs.

* Estimate. **Forecast. Source: South African Canegrowers Association

Sugar cane growers in South Africa are paid by mills based on the quality of sugar cane they deliver at the mill. The quality of sugar cane is measured using an industry agreed formula and is known as the Recoverable Value Tonnage. As a result, growers always aim to supply sugarcane that achieves the highest amount of sugar content that the mill can recover. The price paid to sugarcane growers also takes into account the net revenue obtained from the sale of sugar and molasses in the export and domestic markets. **Table 2** shows that the price paid to sugar cane growers has declined by 15 percent per year over the last two years. The sugarcane price paid to growers decreased by 15 percent to R3,574.41 (US$255) in the 2018/19 MY, from R4,187 (US$299) in the 2017/18 MY, mainly due to low global prices that reduced revenue on the export market, and lower sales in the domestic market.

Table 2: Sugarcane Prices Paid to Growers

MY	Price (Rands/ Recoverable Value Ton)	Percentage Change
2012/13	3,197.32	6%

Sugar:

Production

Post forecasts that South African raw sugar production will increase by 3 percent to 2.3 million MT in the 2019/20 MY. This is based on an increase in the amount of sugar cane delivered to the mills for crushing, higher sugar content of cane, and improved mill efficiencies (sugar recovery rate). Sugar recovery rate refers to the number of kilos of sugar obtained from a metric ton of sugar cane, expressed as a percentage. The improvement in mill efficiencies will be driven by the strategy to improve the financial results of milling companies who performed poorly in the 2018/19 MY due to the low global sugar prices, and low domestic demand for sugar. As a result, the percentage of sugar produced from each ton of sugar cane is forecast to increase to 11.94 percent in the 2019/20 MY, from 11.86 percent in the 2018/19 MY.

Figure 4 shows that sugar production for the 2019/20 MY and 2018/19 MY is above the average sugar production levels. This marks a return to normal sugar production after four years of drought between the 2015/16 MY and 2017/18 MY. However, sugar production is still to reach the peak production levels recorded in the 2002/03 MY.

Consumption

Post forecasts that domestic sugar consumption will decrease by 4 percent to 1.7 million MT in the 2019/20 MY, from 1.8 million MT in the 2018/19 MY. This is due to the decrease in demand of sugar from the beverage sector following the introduction of the tax on sugar sweetened beverages in 2018 and the increase in the tax in 2019. Information on the impact of the sugar tax may be obtained from the following GAIN report published in March 2019, South African Sugar Industry Crushed by Not So Sweet Tax. The 2018/19 MY domestic consumption was also revised downwards to 1.8 million MT from 2.0 million MT, based on the impact of the tax on sugar sweetened beverages.

Sugar in South Africa is primarily used for direct human consumption and for industrial purposes e.g. as an ingredient for producing beverages and confectionary products. The industrial demand for sugar accounts for 60 percent of the total domestic sugar sales, while direct home consumption accounts for 40 percent of the total domestic sugar sales. The per capita consumption of sugar in South Africa is about 45 kg per year, which is higher than most countries in the Southern Africa region whose per capita consumption is below 30 kg per year. However, the South African per capita consumption is still much lower to the U.S. per capita consumption of between 68 to 77 kg per year. The retail price of brown and refined sugar in South Africa ranges from US$1.07 to US$1.20 per kilogram, and is affordable to the majority of the population.

Post forecasts an increase in the use of artificial sweeteners based on the measures undertaken by the beverage sector to either avoid or minimize the impact of the tax on sugar sweetened beverages. The beverage sector has been reformulating their drinks to reduce the sugar content by combining less sugar with an increased use of artificial sweeteners. There are reports that other sectors not impacted by the sugar tax have also voluntarily started reducing the use of sugar and replacing it with artificial sweeteners. This is expected to drive the use and demand of artificial sweeteners in South Africa. South Africa is currently a net exporter of sweeteners as shown in **Figure 5**. However, the increased demand of artificial sweeteners may result in the growth of imports and potential market opportunities for the United States.

Figure 5: Import and Exports of Sweetening Substances (HS 2106.90.35)

Trade:

Exports

Post forecasts that sugar exports will increase significantly by 18 percent to 1.4 million MT in the 2019/20 MY, from 1.2 million MT in the 2018/19 MY. This is due to an increase in sugar production, low domestic demand and the large available stocks. The 2019/20 MY sugar exports are the second highest exports reported since the 2000/01 MY peak exports of 1.7 million MT.

South Africa always exports its surplus sugar regardless of the global prices and sometimes at a loss because of the domestic sugar regulations that stipulate that the price of cane paid to sugar cane growers should be based on revenue obtained from the sugar sales in the local and export market. As a result, South Africa always exports surplus sugar once the domestic market and the South African Customs Union (SACU) markets are adequately supplied. SACU members include South Africa, Namibia, Botswana, Lesotho, Eswatini (Swaziland) and Namibia.

Malaysia is the leading market for South African raw sugar exports accounting for 49 percent of the total raw sugar exports in the 2018/19 MY, followed by the United Kingdom (17 percent), Italy (11 percent), Spain (5 percent), Finland (4 percent), United States (4 percent), and Namibia (3 percent). Raw sugar exports to Malaysia are not consistent and were driven by the large surplus sugar available in South Africa. It is expected that exports to Malaysia will continue in the 2019/20 MY, based on the surplus sugar available in South Africa. Notably, Malaysia is always a net importer of raw sugar to process for further re-exports.

Raw sugar exports from South Africa to the European Union (EU) account for 38 percent of the total South African raw sugar exports in the 2018/19 MY, due to the annual duty free quota of 150,000 MT that South Africa was granted under the Southern Africa Development Committee (SADC)/ EU Economic Partnership Agreement implemented in 2016. Exports to the EU are expected to continue in the 2019/20 MY, despite the uncertainty of the sugar prices in the EU. The impact of Brexit to South Arica sugar exports is currently unknown.

South Africa is a beneficiary of the United States Tariff Rate Quota (TRQ) annual raw sugar allocation of 24,220 MT, which allows it to export raw sugar duty free to the United States. The TRQ amount has remained constant over the last several years. The United States is a premium market for South Africa. South Africa always utilizes its quota allocation each year and is expected to fully utilize the 2018/19 MY and 2019/20 MY quota allocation. The sugar industry marketing year runs from April to March, while the TRQ financial year runs from October to September, which results in the TRQ for two different financial years being recorded in one marketing year. For example, **Table 5** shows that exports to the United States were 56,540 MT in the 2017/18 MY, yet this tonnage refers to the TRQ allocations for two fiscal years.

Mozambique, Namibia, Botswana, Madagascar, United Kingdom, and Angola are the key refined sugar export markets for South Africa. Refined sugar exports have been converted to raw sugar values using a factor of 1.07. BioCom is now the first Angolan company to produce and sell sugar in Angola, and this may have an impact on South African refined sugar exports in the long term should production in Angola increase significantly.

Imports

Post forecasts that total sugar imports will increase by 15 percent to 600,000 MT in the 2019/20 MY, from 520,000 MT in the 2018/19 MY, due to the growth in production in Eswatini who have duty free access to the South African market. The 2018/19 MY imports were revised downwards to 520,000 MT from 600,000 MT, based on the pace of imports up to February 2019 and higher than expected impact of the increase in customs duties from 213.1 c/kg (US$0.15/kg) to 401.79c/kg (US$0.29/kg) effected in August 2018.

Raw sugar imports from Eswatini accounted for 87 percent of the total South African raw sugar imports in the 2018/19 MY because Eswatini is part of SACU and its imports are not subject to any customs duty. This is expected to continue in the 2019/20 MY. Raw sugar imports from Brazil and the United Arab Emirates only accounted for 4 percent of the total South African imports in the 2018/19 MY, down from 20 percent in the 2017/18 MY due to the impact of the increase in customs duties. Imports from Brazil and the United Arab Emirates fluctuate based on the level of customs duty applicable, as explained in the section under import restrictions using the domestic Dollar Based Reference Price.

Refined sugar imports from Eswatini accounted for 26 percent of the total South African refined sugar imports in the 2018/19 MY, followed by Brazil (21 percent) and the United Arab Emirates (13 percent). The percentage share of refined imports from Brazil and the United Arab Emirates decreased from 49 percent and 16 percent in the 2017/18 MY, to 21 percent and 13 percent in the 2018/19 MY, respectively.

Stocks

Post forecasts that the ending sugar stocks will reduce significantly to 135,000 MT in the 2019/20 MY, from 325,000 MT in the 2018/19 MY, based on the increase in exports, partially offset by the increase in imports, increase in sugar production and decrease in domestic consumption. The 2018/19 MY closing stocks were revised upwards due to the rapid change in the beverage sector to reformulate their drinks in response to the tax on sugar sweetened beverages resulting in lower domestic consumption.

All sugar produced in each marketing year is sold at the end of the season in order for the industry to share the revenue between growers and millers as per the agreed Division of Proceeds formulas. High closing stocks pose a cost challenge to the industry as the growers and millers have to pay for the storage of such sugar.

Trade Policies and Regulations:

United States Sugar Tariff Rate Quota Allocation

South Africa is a beneficiary of the United States Tariff Rate Quota (TRQ) allocation, which allows it to export sugar duty free to the United States. The United States is considered a premium market for South African sugar. South Africa confirmed that it has the capacity to export the 24,220 MT that it has been allocated for the 2019 FY, and any additional sugar allocations available. The TRQ amount has remained constant over the last several years. South Africa always utilizes its quota allocation and additional reallocations each year as the United States is regarded as a premium market for the industry.

European Union Sugar Quota and Policies

South Africa was granted an annual quota of 150,000 MT sugar to export sugar duty free to the European Union under the SADC/EU Economic Partnership Agreement that was finalized in October 2016. In the 2018/19 MY, South Africa fully utilized the EU quota and expects to also fully utilize the quota in the 2019/20 MY, despite the uncertainty of production and sugar prices in the EU.

Import Restrictions Based on the Dollar Based Reference Price

South Africa applies the Dollar Based Reference Price (DBRP) mechanism to ensure that, inclusive of the duty, the DBRP (currently US$680 per ton), is the lowest price that an importer will pay for imported sugar. In the event that the import prices are lower than the DBRP, an import duty is applicable, while an import price higher than the DBRP would result in no import duties payable. The DBRP was increased to US$680 per ton in August 2018, from US$566 per ton in order to restrict the increases in imports from Brazil and the United Arab Emirates, and because the DBRP of US$566 per ton was below the cost of sugar production in South Africa. Due to the low global sugar prices, all imports of sugar into South Africa currently attract a customs duty of 401.79c/kg (US$0.29/kg) as shown in **Table 10**.

Customs Import Duties

Table 10: **Customs Duties as of September 2018**

Heading / Subheading	CD	Article Description	Statistical Unit	Rate of Duty (c/kg)				
				General	EU	EFTA	SADC	MERCOSUR

Sugar Tax on Sugar Sweetened Beverages

On December 15, 2017, the South African Revenue Services (SARS) announced that it will start to collect tax from domestic and imported sugar sweetened beverages, excluding 100 percent fruit juices from April 1, 2018 (Click here to download the notice). The tax became effective in April 2018, and was initially set at 2.1 cents per gram of sugar content that exceeds 4 grams per 100ml, which means that the first 4 grams per 100ml are levy free. The tax was later increased to 2.21 cents in 2019. The tax on sugar sweetened beverages has had a severe impact to the sugar and beverage sectors. The beverage manufacturing sector has undertaken several measures to either avoid or minimize the impact of the sugar tax by introducing "low" or zero sugar products, reducing packaging sizes, and reformulating their products to reduce sugar content. This has resulted in the reduction in sugar usage by the beverage sector to at least 30 percent (200,000 MT) since the introduction of sugar tax in April 2018.

The decrease in domestic sugar demand, has consequently resulted in the increase in South African sugar exports at a lower price. South Africa always exports its surplus sugar regardless of the global prices and sometimes at a loss because of the domestic sugar regulations that stipulate that the price of cane paid to sugar cane growers should be based on revenue obtained from the sugar sales in the local and export market for that specific season. As a result, the sugar industry estimates its revenue will drop by up to R1.8 billion (US$129 million), further reducing the price paid to sugar cane growers in the 2018/19 MY. This is expected to have serious viability implications for sugar cane farmers and could put at least 10,000 on farm jobs at risk, with some farms unable to survive. Similarly, sugar milling companies are also under profitability strain due to this revenue loss. Additional information on the impact of the sugar tax may be obtained from the following GAIN report published in March 2019, South African Sugar Industry Crushed by Not So Sweet Tax.

Sugar Marketing and Sales

The South African Sugar Association is by law the only organization permitted to export raw sugar produced in South Africa. Sugar milling companies are only permitted to export refined sugar. South Africa always exports its surplus raw sugar regardless of the global prices and sometimes at a loss because of the domestic sugar regulations that stipulate that the price of cane paid to sugar cane growers should be based on revenue obtained from the sugar sales in the local and export market for that specific season.

The South African sugar industry provides a rebate (discount) to domestic manufactures to promote the sale and use of locally produced sugar.

Electricity Co-generation

The South African sugar industry uses bagasse to generate electricity which is fed back to the sugar mills during peak production periods. None of the electricity generated from the sugar mills is supplied to the national electricity grid due to the absence of appropriate incentives and policy by the government or Eskom the state owned electric company.

Ethanol Production

There is currently no commercial production of biodiesel and fuel grade ethanol from sugar cane in South Africa. However, some of the sugar mills produce beverage grade ethanol, and industrial alcohols as by-products or back-end products from molasses.

Review of the Sugar Act and Sugar Industry Agreement

South Africa is currently in the process of reviewing the Sugar Act (Download the Act) and the Sugar Industry Agreement (Download the Agreement). The process has been underway for at least fifteen years, and it is still uncertain as to when the Department of Trade and Industry will publish the proposed amendments for public comments.

Land Expropriation Without Compensation (EWC)

The impact of the ongoing policy discussion on land expropriation without compensation to the South African sugar industry is uncertain. The sugar industry has no official position on this policy and has decided to await the outcome of the parliamentary process. Please see the March 2018 GAIN report, South Africa Considering Expropriating Land Without Compensation.
